High overhead. Mature cel shading.

Selected direction, consolidated into the game specification package.

Gameplay: the selected overhead reference, with a precise 1.15× whole-scene framing adjustment. Menus: the separate dark cel-shaded reference board. No rear chase-camera reinterpretation.

Reference authority

Read this before implementing any camera, material, model or page.

Gameplay reference

High oblique overhead. Compact local track view. Small, readable car. No sky or horizon. The next version is 15% closer in linear framing.

Menu reference

The lower menu panels guide surfaces, typography and composition. Their large garage cars do not set gameplay size. The board’s top-row chase cameras are rejected.

Material and shape language

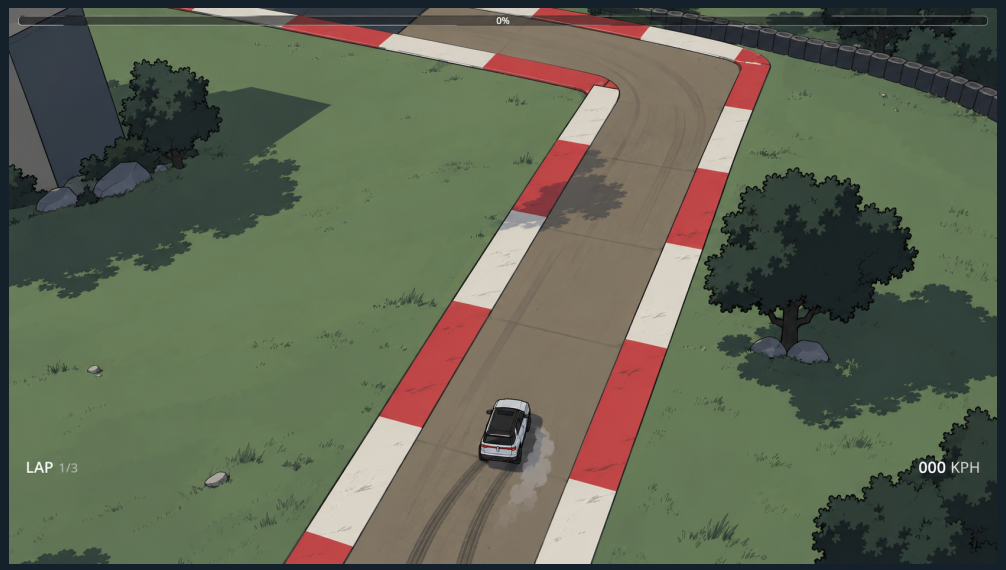

Believable proportions; broad matte colour planes; stepped lighting; selective dark contours; restrained natural colours. Not photorealistic gloss, candy-like props or a toy car. The SUV, brand and night setting in this small reference are not required content.

The selected style is a target for an authored, tested 3D production pipeline. Reference images and crops are preserved for review, not presented as finished models, shaders or a licensed asset library.

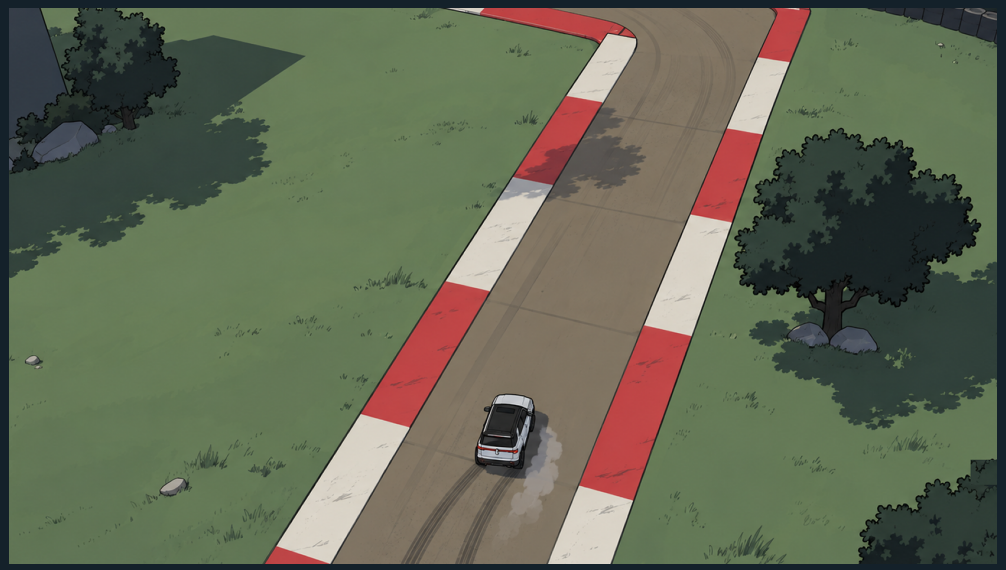

Framing calibration / 1.00× → 1.15×

A camera adjustment, not a car-model adjustment.

USER-SELECTED BASELINE

REQUESTED TARGET

Keep camera angle and car-to-road proportions.

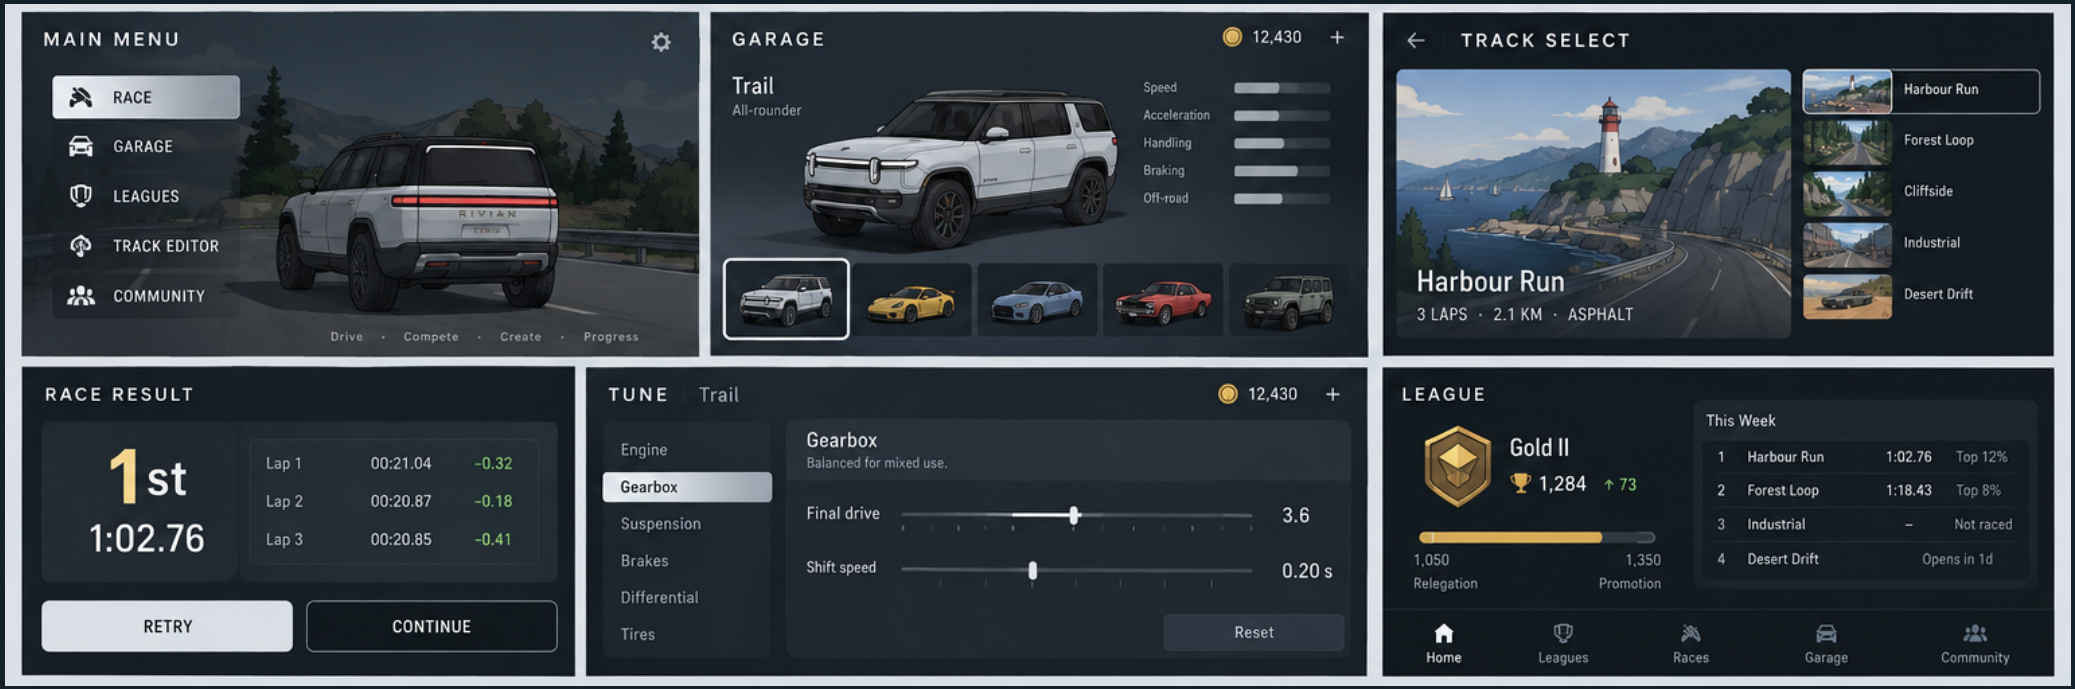

The target is an exact image-space scale about the calibration anchor: linear magnification 1.15; visible extent 0.869565 of baseline. The car mesh, collision dimensions and HUD text size remain unchanged.

In an orthographic engine camera, reduce camera extent by 1.15; moving the camera closer does not itself zoom. For perspective, match the projected result and verify in-engine. This PNG is a framing mockup, not a newly rendered game scene.

Contract: ui/Camera_contract.json • Reproduction details: ui/assets/camera_calibration.json

Menu direction / selected reference

General page styling only. The chase-camera row is deliberately omitted here.

Use deep blue-charcoal surfaces, off-white type, quiet separators, vehicle-led art and restrained state colours. Home, garage, tuning, track selection, results and league views inherit this language.

Keep the game requirements even when the inspiration omits them: global histogram, performance neighbourhood, creator sharing, driving-earned upgrades, free tuning and unlimited retries. No new currency or commercial mechanic is introduced by a visual reference.

Existing proposed catalogue retained. No sale of power, XP or competitive upgrades. No real charge in this prototype.

Settings / control and account

Reference-based interaction layout / current revision

Control layout, reduced motion and privacy remain independent. No connected account operation is performed.

Acceptance / next implementation gate

One visual slice before broad content production.

01 Match the camera

Capture the same calibration scene at the same aspect ratio. Measure projected car size; do not use mesh scaling.

02 Prove the art in motion

One authored car and one corner. Stable outlines, readable shadows and no road/kerb seams.

03 Test all headings

Drive a full lap. Look-ahead, touch zones, scenery and effects must not hide the approach to corners.

04 Measure the device

Record build, renderer, phone, frame-time trace and thermal behaviour. A still image proves none of these.

05 Keep the product intact

Histogram, nearby rivals, earned tuning and unlimited useful racing remain. No pay-to-progress shortcuts.

06 Re-estimate production

P0-V is a provisional 2–4-person-week slice, not the full six-car / twelve-track production estimate.
